

EPS is building new warehouse technology centre

30 November 2008

Ehrhardt + Partner Solutions (EPS), a company belonging to the international warehouse expert group Ehrhardt + Partner, is building a new logistics training and warehouse technology centre at **Dubai Logistics City {DLC}**.

With the new building, EPS's prospective customers in the Middle East will have a unique option. Companies desiring to build a new warehouse or to modernise an existing one can analyse their existing processes in a live environment as well as to test and get to know up-to-date technology.

"Our goal is it to comprehensively support other logisticians, companies and prospective customers in realising their logistic ideas and projects. The construction of the innovative logistics training and warehouse technology centre will decisively contribute to that. The customer can today see and test their future warehouse," said Hermann Ehrhardt, Managing Director, EPS.

In the logistics training centre, EPS will have individual tasks and processes of a warehouse and will present those to prospective customers in a live environment.

This allows the early recognition of optimisation potential and related cost reduction. EPS warehouse experts already instruct prospective customers in the functionality of integrated total solutions for warehouses, in how to create an efficient transparency of processes and how the use of intelligent picking systems and solutions increases the user's profit.

In addition, EPS gives information about the prerequisites and conditions of the valid quality and logistic standards in Dubai.

At the centre, customers can test how the processes of their existing warehouse can be optimised by the application of innovative technologies like radio frequency.
